

IN THE CLAIMS

Please substitute claims 1-17 with the following:

1-3. (Cancelled).

4. (Currently Amended) A battery pack including at least a battery cell and a protection circuit for shutting off overcurrent discharge to a load, wherein

said protection circuit comprising:

shut-off holding means connected between a battery cell positive terminal and an external minus terminal, said shut-off holding means comprising a resistor block of resistance larger than 1 k Ω and smaller than 200 k Ω ; and

a detector for detecting voltage between an external plus terminal and the external minus terminal, wherein the load is connected to the external plus terminal and the external minus terminal; wherein

abnormal discharge by shorting or connecting a low resistance between the external plus terminal and the external minus terminal of the battery pack is shut off, and such discharge shut-off is maintained by the shut-off holding means; and

the discharge shut-off is released to recover discharge upon detecting by the detector the application of a predetermined voltage between the external plus terminal and the external minus terminal of the battery pack.

5. (Previously Presented) The battery pack as cited in claim 4, wherein

said detector is one of a charger detector, a voltage detector, a voltage change detector, an A.C. resistance detector, and a voltage dropper.

6. (Previously Presented) The battery pack as cited in claim 4, wherein said detector is connected to one of a differentiation circuit, and an one-shot circuit.
7. (Previously Presented) The battery pack as cited in claim 4, wherein said discharge shut-off by the shut-off holding means is made by a discharging control switch connected between the battery cell negative terminal and the external minus terminal.
8. (Previously Presented) The battery pack as cited in claim 4, wherein said discharge shut-off by the shut-off holding means is made by a discharging control switch connected between the battery cell positive terminal and the external plus terminal.
9. (Withdrawn) The battery pack as cited in claim 7 or 8, wherein said discharging control switch is one of a mechanical switch, a transistor, and a field effect transistor.
10. (Withdrawn) The battery pack as cited in claim 1, wherein one of a capacitor, and a voltage smoother is connected between the external plus terminal and the external minus terminal.
11. (Withdrawn) The battery pack as cited in claim 1, wherein one of a capacitor, and a voltage smother is connected between the external plus terminal and the external minus terminal, and
- in case of a circuit configuration where the discharging control switch is connected to the battery minus terminal, a resistor is connected between the external minus terminal and the voltage supply terminal for returning overcurrent shut-off or the overcurrent voltage detection terminal of the control IC in the protection circuit, or alternatively in the circuit configuration in which the discharging control switch is connected to the battery plus terminal, a resistor is

connected between the external plus terminal and the voltage supply terminal for returning overcurrent shut-off or the overcurrent voltage detection terminal of the control IC in the protection circuit.

12. (Withdrawn) The battery pack as cited in claim 1, wherein

a p-channel field effect transistor, a resistor and a capacitor are provided as the releasing means for releasing overcurrent discharge shut-off;

the drain terminal of the p-channel field effect transistor and the switch control terminal of the discharging control switch are connected;

the source terminal of the p-channel field effect transistor and the external plus terminal are connected;

a resistor is connected in parallel between the source and gate terminals of the p-channel field effect transistor; and

a capacitor is connected between the gate terminal of the p-channel field effect transistor and the external minus terminal.

13. (Withdrawn) The battery pack as cited in claim 1, wherein

a PNP junction transistor, a resistor and a capacitor are provided as the releasing means for releasing overcurrent discharge shut-off;

the collector terminal of the transistor and the switch control terminal of the discharging control switch are connected;

the emitter terminal of the transistor and the external plus terminal are connected; and

a resistor having a resistance value of $0\ \Omega$ or larger and a capacitor are connected in series between the base terminal of the transistor and the external minus terminal.

14. (Withdrawn) The battery pack as cited in claim 1, wherein
an n-channel field effect transistor, a resistor and a capacitor are provided as the releasing means for releasing overcurrent discharge shut-off;
the drain terminal of the n-channel field effect transistor and the switch control terminal of the discharging control switch are connected;
the source terminal of the n-channel field effect transistor and the external minus terminal are connected;
a resistor is connected in parallel between the source and base terminals of the n-channel field effect transistor; and
a capacitor is connected between the gate terminal of the n-channel field effect transistor and the external plus terminal.

15. (Withdrawn) The battery pack as cited in claim 1, wherein
an NPN junction transistor, a resistor and a capacitor are provided as the releasing means for releasing overcurrent discharge shut-off;
the collector terminal of the transistor and the switch control terminal of the discharging control switch are connected;
the emitter of the transistor and the external minus terminal are connected; and
a block of a series connection of a resistor having a resistance value of $0\ \Omega$ or larger and a capacitor are connected between the base terminal of the transistor and the external plus terminal.

16. (Withdrawn) The battery pack as cited in claim 1, wherein
an inductor, a first capacitor, a second capacitor, and a diode are provided as the releasing
means for releasing overcurrent discharge shut-off;
the inductor and the first capacitor are connected in series;
the other end of the inductor is connected to the external plus terminal;
the other end of the first capacitor is connected to the external minus terminal;
the second capacitor is connected to the junction of the inductor and the first capacitor;
the other end of the second capacitor and the anode of the diode are connected in series;
and
the cathode of the diode is connected to the switch control terminal of the discharging
control switch.

17. (Withdrawn) The battery pack as cited in claim 1, wherein
an inductor, a first capacitor, a second capacitor, and a diode are provided as the releasing
means for releasing overcurrent discharge shut-off;
the inductor and the first capacitor are connected in series;
the other end of the first capacitor is connected to the external plus terminal;
the other end of the inductor is connected to the external minus terminal;
the second capacitor is connected to the junction of the inductor and the first capacitor;
the other end of the second capacitor and the cathode of the diode are connected in series;
and
the anode of the diode is connected to the switch control terminal of the discharging
control switch.
